Docket No.: 05581-00136-US

AMENDMENTS TO THE CLAIMS

- 1. (Currently Amended) A coated, coextruded, biaxially stretched polyolefin film, which comprises at least one base layer B made of polyolefins and a top layer Z made of polyolefins modified using maleic acid anhydride, eharacterized in that wherein a coating made of a primer, which forms the primer layer P, is applied to the surface of the top layer Z, and an inorganic coating made of lithium-potassium polysilicates, which forms a polysilicate layer, is applied to the surface of the primer layer P.
- 2. (Currently Amended) The polyolefin film according to Claim 1, eharacterized in that wherein the coextruded and biaxially stretched basic film has a further top layer on the side diametrically opposite the layer Z.
- 3. (Currently Amended) The polyolefin film according to claim 1, eharacterized in that wherein the polysilicate coating is applied from an aqueous solution of lithium and potassium polysilicates.
- 4. (Currently Amended) The polyolefin film according to claim 1, eharacterized in that wherein the polysilicate coating is a mixture of lithium and potassium polysilicates of the general formula $(\text{Li}_2\text{O})_x(\text{K}_2\text{O})_{1-x}(\text{SiO}_2)_y$, in which x is the mole fraction of Li₂O and y is the mole ratio SiO_2 : K₂O and x = 0.4 to < 1 and y = 1 10.
- 5. (Currently Amended) The polyolefin film according to claim 1, characterized in that wherein the primer layer is a layer made of PVOH.
- 6. (Currently Amended) The polyolefin film according to claim 5, characterized in that wherein the PVOH has a degree of hydrolysis of 85 to < 100 %.
- 7. (Currently Amended) The polyolefin film according to claim 1, eharacterized in that wherein the layer Z contains 80 to 100 weight-percent of said polyolefins and said polyolefins

Docket No.: 05581-00136-US

<u>are</u> a polypropylene homopolymer, propylene copolymer, or polyethylene grafted using maleie acid anhydride.

- 8. (Currently Amended) The polyolefin film according to <u>claim 7</u>, <u>claim 1</u>, <u>characterized in that wherein the polypropylene homopolymer, propylene copolymer, or polyethylene grafted using maleic acid anhydride has a maleic acid anhydride content of 0.05 to 3 weight-percent in relation to the weight of the polymer.</u>
- 9. (Currently Amended) The polyolefin film according to claim 1, eharacterized in that wherein the polypropylene homopolymer, propylene copolymer, or polyethylene grafted using maleic acid anhydride has a melting point of 150 to 165 °C and a Vicat softening point of 120 to 150 °C.
- 10. (Currently Amended) The polyolefin film according to claim 1, characterized in that wherein the layer Z additionally contains > 0 to 30 weight-percent non-modified olefinic polymers made of propylene, ethylene, or butene units.
- 11. (Currently Amended) The polyolefin film according to claim 1, characterized in that wherein the basic film has a further top layer made of scalable polyolefinic polymers on the diametrically opposite surface of the base layer.
- 12. (Currently Amended) The polyolefin film according to claim 1, eharacterized in that wherein the layer Z has a layer thickness of 0.3 to 3 μm.
- 13. (Currently Amended) The polyolefin film according to claim 1, characterized in that wherein first a basic film, which comprises at least the base layer B and the layer Z, is manufactured according to the coextrusion method, and subsequently the surface of layer Z is coated with PVOH and subsequently a polysilicate coating is applied to the PVOH coating.
- 14. (Currently Amended) The polyolefin film according to claim 1, characterized in that wherein the coextruded basic film has further coextruded layers and the basic film is a three-

layered, four-layered, or five-layered basic film and the further layers are synthesized from polyolefins.

- 15. (Currently Amended) The polyolefin film according to <u>claim 14</u>, <u>claim 1</u>, <u>characterized</u> in that <u>wherein</u> the coextruded <u>basic</u> film is a three-layered film having a scalable top layer on the diametrically opposite side of the base layer, which is synthesized from propylene copolymers or propylene terpolymers.
- 16. (Currently Amended) The polyolefin film according to claim 1, eharacterized in that wherein the polyolefin film has an oxygen permeability at 23 °C and 50 % relative humidity of less than 1 cm³/m²*day*bar.
- 17. (Currently Amended) A laminate made of a coated polyolefin film according to claim 1, eharacterized in that wherein the polyolefin film is laminated into a laminate with a polyethylene film using laminating adhesive, the lamination being performed against the polysilicate-coated side.
- 18. (Currently Amended) The laminate according to Claim 17, characterized in that wherein the laminate has an oxygen permeability at 23 °C and 50 % relative humidity of less than 0.5 cm³/m²*day*bar.
- 19. (Currently Amended) The laminate according to claim 17, characterized in that wherein a solvent-free laminating adhesive is used for the lamination.
- 20. (Currently Amended) A method for manufacturing a coated film, eharacterized in that wherein a coextruded, biaxially stretched film is manufactured which has a base layer B and a first top layer Z and a second top layer made of sealable polyolefins, the layer Z being synthesized from polyolefin grafted with maleic acid anhydride and the surface of the layer Z being provided with a PVOH coating and a polysilicate coating being applied from aqueous solution onto the surface of the PVOH coating.

Docket No.: 05581-00136-US

21. (Currently Amended) The polyolefin film according to claim 9, characterized in that wherein the layer Z additionally contains > 0 to 30 weight-percent non-modified olefinic polymers made of polyethylene, polypropylene, propylene terpolymers, and propylene copolymers.
